A boosted fission weapon usually refers to a type of nuclear bomb that uses a small amount of fusion fuel to increase the rate, and thus yield, of a fission reaction.

Boosted fission weapon - Wikipedia

Fusion produces neutrons which dissipate energy from the reaction. In weapons, the most important fusion reaction is called the D-T reaction. Using the heat and pressure of fission, hydrogen-2, or deuterium (2 D), fuses with hydrogen-3, or tritium (3 T), to form helium-4 (4 He) plus one neutron (n) and energy: + + + ...

Fusion energy promises to create a power source without consuming any fossil fuels. Scientific hurdles stand in the way of current approaches which heats isotopes of hydrogen (deuterium and tritium, of DT fusion) to many millions of degrees to achieve the same nuclear reaction that heats the sun.

Interweaving the relative time scale with the atomic time scale poses certain problems because only certain types of rocks, chiefly the igneous variety, can be dated directly by radiometric methods; but these rocks do not ordinarily contain fossils.

Nuclear fusion is much more a branch of physics, rather than nuclear engineering. The two current approaches (tokamak and laser ignition) have nothing in common with the engineering related to nuclear fission reactors.
